

Storyboard: Right-Sizing Your Team

Draft for review

Course	Right-Sizing Your Team: Staffing Ratios for New Team Leads
Type	Self-paced eLearning, about 15 min, 12 screens. Portfolio sample, not built for a client.
Audience	New team leads (first 6 months) in a contact center. They know the operation well but many are nervous about numbers, and they have very little time.
Tool	Written to be built in Articulate Storyline 360.
Objectives	After the course, learners can: • read a staffing ratio and say what it means (O1) • work out how many reps a shift needs, and split reps across queues (O2) • adjust the numbers when the forecast changes or people are off (O3) • choose between staffing options and back the choice with numbers (O4)
Content source	My own Class VIII Proportional Reasoning-2 lesson plan, reworked for adults at work. See the table below.
Notes	BrightLine Support, Ravi and all the numbers are made up. Real rosters also have to allow for breaks, training and shrinkage; screen 4 says so.
Author	Unsi Rathod. Version 1, draft for review.

Where the content comes from

The structure follows my Class VIII lesson: start from something familiar, work one example, then practise. The idli batter and spice mix examples became situations a team lead would recognise.

In the school lesson	In this course	Screens
Equivalent ratios, cross-multiplication (Day 1)	Reps needed for a call forecast, and checking a ratio	4 to 6
Scaling a multi-term ratio by one factor (Day 3, spice mix)	Forecast goes up, team goes up by the same factor	7
Inverse proportion: workers and days, food supplies (Days 7 and 8)	Absences and the email backlog	8, 10
Dividing a whole in a ratio (Days 4 and 5, paint and concrete)	Splitting the team across Voice, Chat and Email	9
Working together at different speeds (Day 9)	Trainees take fewer calls than experienced reps	10
Direct vs inverse summary (Day 10)	Recap and cheat sheet	11, 12

Storyboard

Times add up to about 15 minutes. All feedback text is the wording to use on screen.

Screen	Visual	On-screen text	Audio script	Interaction and notes
1 Title 0:30	Title screen. Simple illustration: team lead at a desk, roster board on the wall behind.	Right-Sizing Your Team Staffing ratios for new team leads [Start]	Welcome. Sooner or later every team lead gets asked the same thing: how many people do I actually need on this shift? Over the next fifteen minutes you'll get a way to answer it. There's a one-page cheat sheet at the end.	Start button. Soft music, fades out under the VO.
2 Monday morning 1:00	Phone-style chat bubble from Ravi. Small roster card beside it showing 12 names.	Ravi (Ops Manager): "Forecast is 90 calls an hour this morning. How many reps do we need?" You have 12 logged in. What's your guess? • 12 • 15 • 18 • No idea	It's Monday, quarter to nine. Ravi's just messaged you. Ninety calls an hour expected, twelve reps logged in. Enough? Have a guess. Nobody's marking it.	Any answer accepted. Feedback: "Thanks. Hold on to that, we'll check it in a minute." Save the choice as guess1 for screen 5.
3 What you'll learn 0:30	Four small icons that appear one at a time with the VO.	By the end you'll be able to: • explain what a staffing ratio is • work out how many reps a shift needs • adjust when the forecast changes or people are off • pick between staffing options and say why	By the end you should be able to read a staffing ratio, work out how many reps you need, adjust when things change, and choose between options and explain why.	No interaction. Next is available straight away.
4 What is a staffing ratio? 1:30	Roster card with three clickable spots. "Heads up" box at the bottom in a different colour.	A staffing ratio compares people to workload. At BrightLine, one rep handles about 6 calls an hour. So the ratio is 1 : 6. Click each card: • 1 rep = 6 calls an hour • 2 reps = 12 calls an hour • Same ratio, however big the team Heads up: real rosters also allow for breaks and training. Use the ratio as a starting point. <i>Footer: figures in this course are made up.</i>	At BrightLine one rep can take around six calls an hour, so the staffing ratio is one to six. Click through the cards. Two reps, twelve calls. Ten reps, sixty. Same ratio, bigger team. One thing to keep in mind: in real life you also have to allow for breaks and training, so treat the ratio as where you start, not where you finish.	Must click all three cards before Next unlocks. Objective O1.

Screen	Visual	On-screen text	Audio script	Interaction and notes
5 Worked example 2:00	Ratio table that builds one row at a time. Arrows showing $\times 15$ across both columns.	Reps Calls per hour 1 6 2 12 5 30 10 60 15 90 Step 1: ratio is 1 : 6 Step 2: $90 \div 6 = 15$ Step 3: $1 \times 15 = 15$ reps Check: $1 \times 90 = 90$ and $6 \times 15 = 90$. Same. You need 15. You have 12. Short by 3. You guessed [guess1].	Let's answer Ravi. The ratio is one to six. The forecast is ninety, and ninety divided by six is fifteen, so fifteen reps. Quick check: cross-multiply. One times ninety is ninety, six times fifteen is ninety. Same, good. Fifteen needed, twelve on the floor, so you're three short. How close was your guess?	Each click reveals the next step (3 clicks). Guess text pulls from guess1. Objectives O1, O2.
6 Your turn 1:00	Two tabs, Wednesday and Thursday, on a simple calendar strip.	Wednesday: forecast is 60 calls an hour. How many reps? [type a number] Thursday: forecast is 45 calls an hour. How many reps do you put on the roster? • 7 • 7.5 • 8 • 9	Over to you. Wednesday's forecast is sixty calls an hour, so how many reps? And Thursday it's forty-five. What goes on the roster?	Wed, 10: "Yes, $60 \div 6 = 10$." Wrong: "Divide the forecast by what one rep can take." Thu, 8: " $45 \div 6$ is 7.5, but you can't roster half a person. Round up to 8." 7: "7 reps take 42 calls an hour, so 3 calls an hour go unanswered." 7.5: "Right sum, but round up." 9: "That covers it but 8 is enough ($8 \times 6 = 48$)." Two attempts each. Scored, O2.
7 The forecast changes 1:00	Slider with two bars (calls per hour, reps needed) that grow together as it moves.	10:00. A promo email goes out and the forecast jumps from 90 to 120 calls an hour. The three late reps have logged in, so you have 15. Drag the slider. $120 \div 90 = 4/3$ $15 \times 4/3 = 20$ reps If the workload changes by a factor, change the team by the same factor. Need 20. Have 15. Short by 5.	At ten o'clock a promo email goes out and the forecast jumps to a hundred and twenty. That's four-thirds of what it was, so the team has to be four-thirds of what it was too. Fifteen times four-thirds is twenty. You've got fifteen, so you're five short. Drag the slider and watch both bars move together.	Slider must reach 120 before Next unlocks. Objective O3.

Screen	Visual	On-screen text	Audio script	Interaction and notes
8 When people are off 2:00	Two-column graphic ("more calls, more reps" / "more reps, fewer hours") shown after the example.	Tuesday. The email backlog is 48 rep-hours of work. 8 reps take 6 hours ($8 \times 6 = 48$). Two reps call in sick. $6 \text{ reps} \times ? \text{ hours} = 48$, so 8 hours. Fewer reps, longer job. More reps, shorter job. Try it: with 12 reps, how many hours? [type a number]	Different problem now. There's an email backlog, forty-eight rep-hours of work in total. Eight reps get through it in six hours. Then two of them call in sick. The work hasn't got any smaller, so six reps need eight hours. Fewer people, longer job. That's an inverse relationship, not like the calls, where more calls meant more reps. Your turn: how long would twelve reps take?	Answer 4. "Yes, $48 \div 12 = 4$ hours." Wrong: "The total work is 48 rep-hours. Divide it by the number of reps." Scored, O3.
9 Splitting the team 2:00	Rep icons move into three queue lanes as each step is revealed.	You have 20 reps to split across Voice, Chat and Email. Ravi wants 5 : 3 : 2. Add the parts: $5 + 3 + 2 = 10$ One part: $20 \div 10 = 2$ reps Voice 10, Chat 6, Email 4 Check: $10 + 6 + 4 = 20$ Ravi changes his mind: 6 : 3 : 1. Same 20 reps. How many in each queue? [Voice] [Chat] [Email]	You've got twenty reps to spread over Voice, Chat and Email, and Ravi wants five to three to two. Add those up: ten parts. Twenty divided by ten is two reps a part. So ten on Voice, six on Chat, four on Email. Always add them back up to make sure you still have twenty. Now Ravi's changed his mind. Six to three to one. What does that look like?	Answer 12 / 6 / 2. " $6 + 3 + 1 = 10$, one part is 2 reps, so 12, 6 and 2." Wrong: "Add the parts first, then divide the total by that." If the three numbers don't add to 20: "Your queues add up to X, not 20." Scored, O2 and O4.
10 Friday decision 2:30	Split screen. Left: Ravi's message and the situation. Right: a small calculator panel (call capacity = $\text{reps} \times 6$; backlog hours = $48 \div \text{reps}$).	Friday, 10:00. Forecast 120 calls an hour, so you need 20 reps on calls. You have 17. The email team (8 people) is clearing the 48 rep-hour backlog, due by end of shift (8 hours). Ravi: "What are you going to do?" • A. Move 3 reps from email to calls • B. Borrow 3 trainees. Each takes 4 calls an hour. • C. Change nothing and accept longer waits	Friday, ten o'clock. You need twenty reps on calls and you've got seventeen. Meanwhile the email team of eight is working through that forty-eight rep-hour backlog, due by the end of the shift. Ravi wants to know what you're going to do. Try the numbers in the calculator before you decide.	A: "Calls are covered, $17 + 3 = 20$. But 5 people left on email means $48 \div 5 = 9.6$ hours. That's past the end of the shift, so the backlog will be late." B: " $17 \times 6 = 102$, plus $3 \times 4 = 12$, is 114 calls an hour. Forecast is 120, so you're still 6 an hour short, about one rep." C: " $17 \times 6 = 102$, so 18 calls an hour go unanswered. That's roughly 1 call in 7." Ravi after any choice: "What about a bit of both? Borrow the three trainees, then take one person off email. Calls reach 120. Email has 7 people, $48 \div 7$ is about 6.9 hours, so it still finishes in the shift." Full marks for A or B with a reason that uses the numbers. Partial for C. Optional one-line "why did you choose that?" box, not scored. Scored, O4.

Screen	Visual	On-screen text	Audio script	Interaction and notes
11 Recap 0:30	Five cards. Clicking one takes you back to that screen (optional).	A ratio compares people to workload, e.g. 1 : 6. Reps needed = forecast ÷ calls per rep. Round up. Workload changes by a factor? Change the team by the same factor. Fewer people means a longer job (reps × hours stays the same). To split a team, add the parts, then divide the total by that sum.	Quick recap. A ratio compares people to workload. Divide the forecast by what one rep can take, and round up. If the workload changes, change the team by the same amount. Fewer people means a longer job. And to split a team, add up the parts and divide.	Cards are optional to click.
12 Cheat sheet and feedback 0:30	Thumbnail of the cheat sheet next to the download link.	Download the one-page cheat sheet (PDF). How was it? Rate 1 to 5: • The examples felt like my job • I could use this on my next shift • The pace was right <i>You'll get a short check-in in 30 days to ask if you've used the cheat sheet.</i> [Finish]	Before you go, grab the cheat sheet. It has the steps from this course on one page. Then tell us how it went with three quick questions. Thanks for your time.	Finish sends completion to the LMS. Survey is reaction-level feedback. Voice artist TBC. Use scratch audio for the first review.

Objectives and where they're practised

	Objective	Where it's practised
O1	Read a staffing ratio and say what it means	Screens 4 and 5
O2	Work out reps needed; split reps across queues	Screen 6 (scored), screen 9 (scored)
O3	Adjust when the forecast changes or people are off	Screen 7, screen 8 (scored)
O4	Choose an option and justify it with numbers	Screen 10 (scored)
